                                                                                                                                                                                                                                                                                                  AAQ70611 codes for a yeast HMG-CoA reductase 2, AAR58611. Using the A. tumefaciens vector pXYLX71, AAQ70611 was used to produce transgenic plants with increased HMG-CoA reductase activity. Plants with increased HMG-CoA reductase activity were found to have greater squalene and sterol accumulation, and therefore increased insect resistance. (Updated on 25-MAR-2003 to correct PF field.)

Geranylgeranyl pyrophosphate synthase; diterpene; diterpene precursor; diterpene synthase; defence toxin; volatile defensive signal; pollinator attractant; photoprotectant; HMG-COA reductase; enzyme. US2004072323-A1 05-JAN-2001; 2001US-0259880P 07-JAN-2002; 2002US-00041018 Saccharomyces cerevisiae. HMG-CoA reductase polypeptide #32. (MATS/) MATSUDA S P T. (HART/) HART E A. 15-APR-2004.

The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene or diterpene precursor and a method of isolating a diterpene synthase comprising growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic the cells. New unicellular organisms comprising exogenous nucleic acids encoding a geranylgeranyl pyrophosphate and a diterpene synthase, useful for producing diterpenes and diterpene precursors. Disclosure; SEQ ID NO 199; 38pp; English

cells further comprises at least one isolated and d sequence of a yeast expression library, and the e

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                  The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid sequence is regulated by an inducible promoter under conditions where the expression is induced, filtering the cell/resin mixture, extracting the cell/resin mixture with alcohol to produce an organic eluent and analysing the organic eluent by a screening method including chromatography and/or spectroscopy, to identify the nucleic acid sequence encoding the diterpene synthase. The unicellular microorganism is useful as a diterpene or diterpene precursor producing system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents an HMG-COA reductanse polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from
the organism. The invention also relates to methods of producing a diterpene or diterpene precursor and a method of isolating a diterpene synthase comprising growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified mucleic acid sequence of a yeast expression library, and the expression of the
                                                                                                                                                                                                                                                                               geranylgeranyl pyrophosphate and a producing diterpenes and diterpene
                                                                                                                                                                                                                                                                                                  New unicellular organisms comprising exogenous nucleic acids encoding geranylgeranyl pyrophosphate and a diterpene synthase, useful for

New unicellular organisms comprising exogenous nucleic acids encoding geranylgeranyl pyrophosphate and a diterpene synthase, useful for producing diterpenes and diterpene precursors

Disclosure; SEQ ID NO 264; 38pp; English

The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene precursor and a method of isolating a diterpene synthase comprising growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic a yeast expression library,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid sequence is regulated by an inducible promoter under conditions where the expression is induced, filtering the cell/resin mixture, extracting the cell/resin mixture with alcohol to produce an organic eluent and analysing the organic eluent by a screening method including chromatography and/or spectroscopy, to identify the nucleic acid sequence encoding the diterpene synthase. The unicellular microorganism is useful as a diterpene precursor producing system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents an HMG-COA reductants and photoprotectants of the invention. Note: The sequence data for this patent did not form part to the printed specification but was obtained in electronic format from
The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene precursor and a method of isolating a diterpene synthase compristing growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified nucleic
                                                                                                                                                                                                                                                                                                                                                                                                              New unicellular organisms comprising exogenous nucleic acids encoding geranylgeranyl pyrophosphate and a diterpene synthase, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2004-373921/35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matsuda
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-JAN-2001; 2001US-0259880P

         The invention relates to a unicellular organism for producing a diterpene or diterpene precursor comprising an exogenous nucleic acid sequence encoding a geranylgeranyl pyrophosphate synthase under the control of a promoter operable in the organism, and an exogenous nucleic acid sequence encoding a diterpene synthase under the control of a promoter operable in the organism. The invention also relates to methods of producing a diterpene or diterpene precursor and a method of islating a diterpene synthase comprising growing several cells in the presence of a polyaromatic resin to make a cell/resin mixture, where at least one of the cells further comprises at least one isolated and purified nucleic the cells further comprises at least one isolated and purified nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid sequence is regulated by an inducible promoter under conditions where the expression is induced, filtering the cell/resin mixture, extracting the cell/resin mixture, extracting the cell/resin mixture with alcohol to produce an organic eluent and analysing the organic eluent by a screening method including chromatography and/or spectroscopy, to identify the nucleic acid sequence encoding the diterpene synthase. The unicellular microorganism is useful as a diterpene or diterpene precursor producing system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents an HMG-CoA reductase polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from
                                                                                                                                                                                                                                               New unicellular organisms comprising exogenous nucleic acids encoding a geranylgeranyl pyrophosphate and a diterpene synthase, useful for producing diterpenes and diterpene precursors.
                                                                                                                                                                                                                                                                                                                                                                Matsuda SPT,

The unicellular microorganism is useful as a diterpene or diterpene precursor producing system. Diterpenes, in plants, serve as defence toxins, volatile defensive signals, pollinator attractants and photoprotectants. This sequence represents an HMG-CoA reductase polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from
          The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                   Penn
                                                                                                                                                 Claim 27;
                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                    WPI; 2001-488901/53
